

QUICK PRESENTER GUIDE

Virginia Unmanned Systems Asset Map

A three-page screen-share reference for Ale and Chelsea

10-MINUTE DEMO

GOAL: find useful patterns and collect specific, source-backed corrections

Open: cosolve-asset-map.onrender.com/map/

Before sharing

- **Sign in early.** The hosted site may need 30–90 seconds to wake up.
- **Start clean.** Use Current appearance, Clear all, Reset, and only Asset points plus Virginia boundary.
- **Prepare one relevant example.** Choose a region, capability, organization, or test site that matters to the stakeholder.
- **Protect the screen share.** Close private tabs, email, messages, and password managers.

Opening script This is a source-linked, living inventory of Virginia's unmanned and autonomous systems ecosystem. It is a working resource, not a claim that every asset is already included. I would value your help identifying missing records, correcting descriptions, and pointing us to current public sources.

Recommended click order

1. **Start statewide.** Show the Virginia boundary, asset points, clusters, and matching list.
2. **Make it relevant.** Filter by the stakeholder's region, asset type, domain, capability, or mission.
3. **Search something familiar.** Find their organization, a known facility, program, or city.
4. **Open one profile.** Show what it is, why it matters, location precision, sources, and review date.
5. **Add one layer.** Use only the region, county, airspace, test-site, or other context needed for the question.
6. **Analyze if useful.** Use a regional summary, radius, rectangle, polygon, or visible map extent.
7. **Save the result.** Copy the exact view link, save a view, print a PDF, or export selected records.
8. **Close with corrections.** Ask what is missing, inaccurate, outdated, or located too precisely.

Feature Cheat Sheet

FEATURE	WHAT TO SAY OR DO
Filters	Search by name, description, city, activity, source, or related records. Choices within one group broaden the match; different groups narrow it. Active chips appear above the right-hand results.
Map + results	The center map and right-hand asset list show the same records. Click a cluster or zoom to separate nearby points; click a point or result card to open the record.
Asset profile	Shows identity, relevance, classifications, activity, related assets, public contact route, location precision, sources, review status, and Suggest an update.
Layers	Asset points and Virginia boundary are on by default. Optional context includes regions, counties, potential MPZ tracts, heliports, airspace, test facilities, verification, and location precision.
Analyze	Find nearby assets or select a rectangle, polygon, visible extent, or ecosystem region. The right panel updates to the selected records and can show a regional summary.
Save / export	Save the map state, copy its exact link, print a PDF, enter Presentation mode, or export selected records. Shared links still require an authorized account.
Directory	Use the text-first record list when reading and comparing is more useful than spatial context. Its filters match the map.
Regions + About	Regions compares documented inventory and data-quality signals. About data explains sources, verification, precision, and limitations.
Appearance	Current, Dark, Color, Showcase, and Showcase Light change presentation only. They do not change the records or filters.

Best practice Turn on one analytical layer at a time. If the map becomes busy, switch to the Light basemap and turn optional overlays off.

Questions worth asking

- Which important organization, facility, program, test site, or operating environment is missing?
- Is this the correct site, campus, locality, or regional location?
- Is the description and current activity accurate today?
- Are the capabilities, mission areas, domains, and strategic categories right?
- What direct public webpage should verify this information?
- What public contact route should a serious stakeholder use?
- Is any location more precise than is appropriate to publish?
- What are the three highest-priority corrections or additions?

Guardrails and Quick Fixes

Do not overclaim

- **Not a complete census.** It is a working inventory that improves through review.
- **Counts are not rankings.** More records do not automatically mean a stronger ecosystem.
- **Source-backed is not the same as reviewed.** Use the status and date shown on the profile.
- **Airspace layers are not flight permission.** Operators must use current FAA sources and approvals.
- **Potential MPZ tracts are candidates only.** They are not federal designations.
- **Never enter sensitive information.** Exclude classified, CUI, export-controlled, live operational, credential, or security-sensitive details.

If something goes wrong

ISSUE	QUICK FIX
Slow first load	Wait 30–90 seconds, then refresh once.
Too few results	Review the active filter chips; remove one or choose Clear all and reapply the intended filters.
Map symbol	For a numbered cluster, click or zoom. For a missing point, check the record's location-precision label.
Layer is confusing	Use the Light basemap and keep only one analytical overlay visible.
Shared link fails	The recipient needs an authorized account, and a saved view must have link sharing enabled.
Data is disputed	Capture the correction and direct public source; do not verify it during the call.

After the interview

1. **Record the request.** Add an internal review comment when Admin is available.
2. **Check the source.** Confirm it directly supports the proposed factual change.
3. **Update only supported fields.** Do not infer capabilities, activity, contacts, or readiness.
4. **Verify in order.** Verify and date the public source first; leave a change reason and keep uncertain assets unverified.

Access reminder Stakeholders need separate authorized accounts. Admin appears only for staff, and editing depends on assigned permissions. Never share an administrator login.

For detailed layer definitions, editing procedures, and FAQs, use the full COSOLVE Stakeholder Screen-Share Guide.
